CORE SERVICES OFFERED by the SSQL

The broad goal of the Social Sciences Quantitative Laboratory (SSQL) is to increase quantitative skills for social sciences students already involved in quantitative learning and to entice students unfamiliar with quantitative methods to dive in. It uses four services to meet this goal: workshops, in-class support for methods courses, individual meetings with students, and support for faculty developing curricula and homework.

Workshops

The first service is a series of workshops designed to deliver concrete data analysis skills. The SSQL allows unusual flexibility in designing the curricula for these workshops. The topics span introductory sessions on statistical programming to advanced topics such as preparing for data analysis interviews and digital methods in social science. A full description of each workshop is found in the “Workshops Offered” section of this overview. The laboratory has run 32 unique workshops across 199 two-hour sections and 14 one-hour sections. Approximately 985 unique students attended these workshops. Most programming workshops employ a student to help debug the programs attendees created. These students sharpened their skills working with others on common data issues while reviewing their own data skills. These student employees provided invaluable support for the workshops.

In-Class Support for In-Class Coding

The second service is in-class support for methods courses that incorporate in-class coding exercises. This is primarily troubleshooting students’ code during class, and occasionally extends to leading lessons.

Individual Meetings

The third service is individual meetings with students. A total of 231 unique students met with Ella across 590 meetings spanning 917 hours. This comes out to an average of 65.5 hours meeting with students per semester. The graphic on page 3 of this overview shows a rough breakdown of how these hours were distributed across each department. These students received help on program debugging, homework, survey design, statistical methods, research projects, and more. They engaged with many interesting projects, including public opinion on climate change, COVID in prisons, voting patterns in Michigan, and racially based attitudes towards campus protest culture. This resulted in at least one publication in Brown’s Journal of Philosophy, Politics, and Economics in 2022. The laboratory provided students with support and skills to tackle more advanced homework assignments, design more sophisticated research questions, and analyze their class readings more effectively.

Faculty Support

The fourth service the SSQL provided is support for faculty in developing curricula and homework. Ella met with faculty and staff more than 455 times to discuss course objectives, how to incorporate statistical techniques into their classes, and how the laboratory could assist their students. She has distributed student-accessible datasets, developed a wide variety of lessons plans, and co-created multiple homework sets. She has discussed methods for providing quantitative support with faculty and staff members associated with quantitative analysis institutes and curricula at Yale, Wellesley, Washington and Lee, Vassar, Bryn Mawr, Haverford, Bowdoin, Williams, and others.

The SSQL helped faculty at Swarthmore and other colleges transition to remote learning during COVID through workshops that Ella proposed, co-organized and co-led, as well as videos and tutorials. This resulted from Ella’s collaborations with faculty at LACOL colleges to create and deliver an online liberal arts data science course. Through this course, Ella and the other co-instructors gained expertise in effective remote teaching well before COVID forced us all to become experts in remote work.

Job Description: Social Science Quantitative Laboratory (SSQL) Associate

The SSQL associate will promote students' quantitative and computational skills by providing tutorial services that support the coursework and research component of courses in the social science curriculum. The associate's responsibilities include the following:

- Familiarizing students with statistical software such as Stata, Matlab, R, Excel, Qualtrics, and SAS widely used in the social sciences.
- Being available Fall, Winter, Spring, and Summer to meet with social science faculty teaching quantitative courses to collaborate on how best to support their work with students and their course expectations.
- Assisting students with the identification, manipulation, and analysis of data sets.
- Offering mini-courses on essential dimensions of independent research such as data-cleaning, merging data sets, creating visual representations of data, creating and editing variables, and exporting data analyses into various platforms.
- Being available during regular office hours and at other times for data management advice and support to students at all stages of their empirical research.
- Creating opportunities for students with less experience in quantitative and computational methods to develop skills and confidence.

Qualifications: Master of Arts/Science (MA or MS) in Statistics, Computer Science, Applied Mathematics, or Economics. Programming experience in Stata, Matlab and/or R. Some familiarity with social scientific application of quantitative methodologies is strongly preferred.

DISTRIBUTION of SSQL SERVICES ACROSS DEPARTMENTS

- As the SSQL developed, less time was spent on one-on-one meetings, and **more time was spent reaching students and supporting faculty through workshops and classes**. As seen in the graphics below, this is reflected in more hours individually meeting with students and faculty in 2017-18, and more interactions with students in workshops in subsequent semesters.
- Methods courses are run in Economics every semester. As seen in Figure 2, this is reflected in relatively consistent interactions with Economics prior to her leaves of absence in Fall '22-Spring '23. As seen in Figures 1 and 2, interactions with Political Science and Sociology/Anthropology spiked when those departments had methods courses.
- Spring '20 was the beginning of COVID. The SSQL supported the three departments and other portions of the college in the transition to online learning. **Since this support involved faculty workshops and individuals outside of the three departments, it is not reflected in graphs below**. Overall, more time was spent preparing workshops and less time was devoted to running workshops or one-on-one meetings with students. This preparation directly led to the increase in meetings and workshops during Spring '21.
- Ella had health challenges that required multiple surgeries, treatments, and leaves of absences from Spring 2022-Spring 2023. This is reflected in less time spent in meetings and workshops during this time period.

These graphs do not include interactions with individuals outside of the three listed departments. Figure 2 includes support provided within Political Science and Sociology methods classes during Fall '17, Spring '19, J-term '21, Spring '21, Fall '21, and Spring '23

DIVERSITY and ACCESSIBILITY

Encouraging a broad range of students to participate in data science is a key role of the SSQL. This involves addressing challenges with computer literacy, accessible computing environments, inclusive classroom environments, and socially relevant datasets and examples. The result of this work has been strong interactions with a wide variety of students. The demographic makeup of SSQL workshops and the students who attend office hours demonstrate atypical data science attendance. This is particularly true in office hours. The SSQL sees men and women in equal measure, diverse racial/ethnic compositions, and students from a wide array of class backgrounds.

Computer Literacy & Accessible Computing Environments

Computer literacy and inaccessible computing environments regularly frustrate students and limit their ability to engage. An increasing number of students are primarily familiar with mobile operating systems, which require less proficiency with the keyboard, the mouse, and file management. Familiarity with more complex computing environment has a clear overlap with both racial and economic demographics. Reducing some of these barriers requires teaching students how to work with their computers, and others require changing the computing environment they are accessing.

Accessible Computing Environments: Not all computers provide accessible environments for programming and data management. These problems can typically be overcome by adjusting the settings or switching to a different interface. However, the amount of time required to fix these issues can be prohibitive, particularly during tightly scheduled workshops. Even university maintained machines or cloud environments can pose accessibility challenges. In one workshop, 15% of the students could not access required files due to incompatible settings in a university maintained cloud environment, and 15% could not fully run their code due to memory limitations on their personal machines. Some campus computers open programming files as pdfs, stymieing students' ability to work with them. In general, 2-35% of any given group of students will encounter technical difficulties outside of the students' control or ability to manage. The SSQL manages these difficulties with deep expertise in debugging code, adjusting computer settings, and ensuring that there are backup computing environments available.

Departments such as Computer Science, which have a long history of live coding in class, manage this by maintaining very tight control over their physical and cloud based computing environments. Students are not expected to complete classwork on their own idiosyncratic computers; they are expected to spend a lot of time on machines controlled by the Computer Science department.

Keyboard, mouse, and window management skills: Students regularly enter college with only basic knowledge of keyboard, mouse, and window management. Fluent coding requires much more than rapid touch typing; keyboard and mouse shortcuts are integral. Code and data are regularly highlighted, cut, copied, pasted. Code is run, commented, and formatted. Most of this is possible to do with a mouse, but the difference between 2-8 seconds for a mouse click and 1/10th of a second for a keyboard click very quickly adds up. Window management is equally important. Modern sophisticated user interfaces try to limit the amount of screen management required, but sacrifice the flexibility needed for effective coding and data management. For coding and data management, information must be regularly transferred between programs and within screens in a given program.

File management: Students' abilities to work with data dramatically improve after they learn file types and file management. But teaching this seemingly small task is not simple. Each computer is different.

Some have program locks. Others are struggling to function, operate in a foreign language, have different operating systems, or have settings that hide file paths. Helping students to effectively manage files requires teaching how to work with their system as well as adjusting the settings on their computers.

The SSQL has worked to reduce these barriers. After seeing an increasingly strong need for these skills in workshops and individual meetings, the SSQL developed and has begun to a workshop called “Computer Hacks to Save You Time”. The SSQL has also adjusted the format of workshops to highlight these skills, provide backup methods to access needed hardware and software, and to normalize the differences in skills between generations of computer users.

One of the challenges facing the SSQL in the future is further streamlining access to computing environments, both in terms of students’ computing literacy and ensuring equitable access to a functional computing platform.

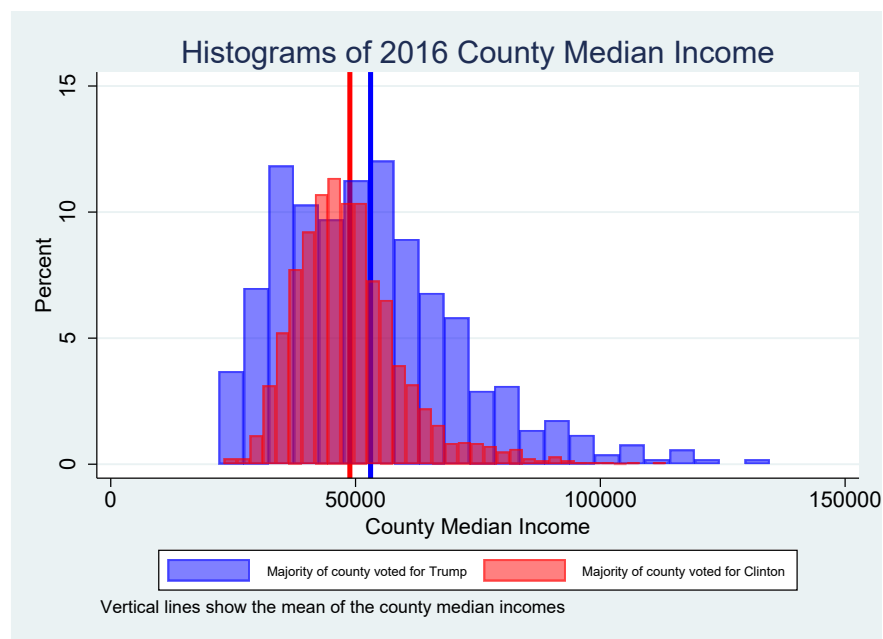

Inclusive Classroom Environment

Introductory programming lessons can be a conversation between the student, teacher, and programming interface. Each member of this triad adapts to meet the needs of the others. Students learn skills, teachers identify idiosyncratic challenges presented by the computing environment and the student’s computer literacy, and the computers communicate their errors and have their settings adjusted. This dialogue flows best in an inclusive classroom environment. This includes ensuring that students speak up, that computer error messages are visible to the teacher, and that the teacher pays attention to technical difficulties.

- Part of ensuring that students speak up is norming gaps in skills and the idiosyncratic challenges their computer environment will present. That is, a student with less exposure to computing is not failing because they cannot use a computer as quickly as the person sitting next to them. They simply have not yet acquired certain key skills, or they need to adjust some computer settings.
- Making computer error messages visible requires attention to the physical space. This is relatively easy in a computer classroom. Slack environments can help students share screenshots of computer errors digitally. In Zoom sessions, the student can share their screen and the teacher can annotate on the screen or take virtual control of the student’s machine. The SSQL office space is set up to allow students to mirror their laptop screens on one the office monitors, thereby allowing both teacher and student to see the same information without uncomfortable crowding.
- The SSQL detects technical difficulties in a number of ways. The first is by encouraging students to speak up. The second is by having regular check-ins to see if the students have successfully run a piece of code or made a piece of software work. Ella asks students to give a thumbs up if the task is completed, a thumb to the side if they are still working on it, and a thumb down if something is going wrong. The third way to detect technical difficulties is to have TAs circulating the classroom watching for computer errors.

Meaningful Datasets and Examples

Addressing computer literacy, accessible computing environments, and inclusive classroom environments goes a long way to promoting student diversity. One additional way to reach a broad range of students is by using datasets and examples relevant to their lives. The introductory coding workshops typically use data collected from the student participants themselves. This includes information about the students' class year, their appreciation of Sharples food, their height, sleep patterns, and more. More advanced workshops use data on voting patterns across the United States split across economic and racial categories. Visuals tend to grab attention, and two of the most interesting patterns are included below.

ADMINISTRATION

Scheduling Workshops

For semester long courses, scheduling and record keeping is managed by the registrar's office. The SSQL must schedule workshops and maintain records of student attendance independent of the registrar's office.

The workshop schedule is largely determined prior to the first day of class. Workshops for "Introduction to Econometrics" set the schedule for all other workshops. This course requires 2-3 workshops delivered across 8-21 sections each semester, and there is less flexibility in the timing of the workshops. Prior to the beginning of the semester, the SSQL:

- Communicates with all faculty members who want a workshop to determine the timing for each workshop.
- Circulates a schedule of workshops to all faculty members so they can include them in their syllabi.
- Updates the SSQL website with the list of workshops.

The SSQL seeks to achieve the following goals when scheduling workshops.

1. Ensure that all students required to attend are able to attend.
2. Run small workshops, 5-20 students each, to allow Ella and her teaching assistants to effectively solve coding bugs and other computer errors.
3. Require minimal additional work from the professor.
4. Streamline the registration process for students.
5. Minimize the number of students who miss a required workshop, since they inevitably ask for an individual meeting to make up the material they missed.

To accomplish these goals, the SSQL uses the following procedure.

- Obtain emails for all students being required or recommended to attend the workshops.
- Send an initial scheduling survey to check student availability. This only needed when students are required to attend a workshop for a class. This survey also gathers additional useful information from students, such as prior programming experience.
- Send reminder emails to students who are late replying to the availability survey.
- Set workshop times based on student availability and maximum attendance constraints.
- Book classrooms for lessons.
- Send calendar invitations and registration information to students.
- Distribute a general registration notice for any additional students who would like to attend the workshop. This is done by email, the SSQL website, and physical flyers on campus.
- Maintain and update a list of students who have registered for the workshop.
- Email reminders for the workshop the day before the workshop.
- Send out the materials for the workshop prior to the start of the workshop.
- Notify students who miss one of the early sections of the workshop that they can reschedule for one of the future sections.

Record Keeping

The SSQL keeps records of workshop attendance, individual meetings, workshops and lectures attended, and presentations given both within the college and at external conferences. This allows the SSQL to:

- maintain accurate records of student and faculty engagement;
- track the of the amount of time Ella spends in individual meetings and in workshops, as well as how much time students and faculty spend interacting with Ella;
- broadly describe the distribution of time spent across the three core departments.

These records are used throughout this document to track the impact of the SSQL.

Website Management

The SSQL's website, www.swarthmore.edu/ssql, is the landing page for students and faculty seeking to learn more about workshops and how to contact the SSQL. It should be updated on a regular basis with new workshops and updated registration links.

The SSQL also occasionally uses a github page (<https://github.com/swat-ssql>) to distribute interactive graphics and datasets to students.

Student Employment

The SSQL has traditionally hired and trained students as both laboratory assistants and as teaching assistants.

Budget Management

The SSQL has a budget for expenditures. These expenditures are tracked and submitted to an administrative assistant for reimbursement. The expenditures typically include:

- Food purchases for workshops, including fruit, desserts, and pizza.
- Student employment.
- Travel for conferences.
- Books, markers, binders, paper, and other teaching materials.
- Software needed for administration.

Advertising

The SSQL advertises its services in multiple venues:

- Via the SSQL website as www.swarthmore.edu/ssql.
- Emails to faculty and students.
- Flyers distributed around campus.

Social Sciences Quantitative Laboratory

Workshops Offered

Default time: 2 hours

DATA ANALYSIS WORKSHOPS (NO PROGRAMMING)		
Interpreting Regressions	Many books and papers present regression results to support their arguments. There are some simple ways to scan these tables that let you quickly understand the main points and common pitfalls. We cover how to read regression tables and graphs efficiently, what the numbers for coefficients and statistical significance mean, and common ways regressions are misused.	No prerequisite
How to Read a Quantitative Paper	This 1 hour session focuses on reading and interpreting quantitative papers. This includes skimming techniques as well as examining regression tables, connecting them to scatterplots and regressions lines, and interpreting other common statistical summaries.	No prerequisite; 1 hour
Computer Hacks to Save you Time	Knowing your keyboard and computer's file structure saves a lot of time, possibly as much as 64 hours per year. That's 2.5 days that you could be sleeping, hanging out with friends, or studying more efficiently. This introductory workshop is designed for beginner and intermediate level computer usage. In other words, this workshop is for you if any of the following apply to you: you don't know what Ctrl+a or Cmd+a does, you generally want to practice a variety of keyboard shortcuts, you want to improve your folder structure systems, or you want to know what a .zip file is.	No prerequisite
Nuts and Bolts of Remote Peer Assistance	This workshop provides hands on practice managing Zoom sessions and hosts/cohosts, writing information via whiteboards/document cameras/tablets, using shared documents online, annotating on other's screens, and taking virtual control of other's machines.	No prerequisite
Where to Find Data	Many research ideas are generated by creating questions answerable by existing data sources. We cover some commonly used data sites, how to navigate these sources, and how to search for specific questions in surveys. We also use Google Sheets to easily create some basic graphics to summarize data on public opinions of global warming.	No prerequisite
Manipulating Data in Google Sheets	Google sheets provides an intuitive tool to create multiple numeric descriptions of data, as well as scatterplots, bar charts, maps, and more. This workshop uses a sample dataset on world life expectancy, population, and GDP by country over 50 years to demonstrate these functionalities.	No prerequisite
Finding Data and Using It in Google Sheets	Using Google Sheets to create descriptions of your own data requires knowledge of data formatting issues, sorting data, and merging data by hand. We cover some of the common issues in finding your own data, how to efficiently select data to answer a general topic, and how to manipulate your own data in Google Sheets.	Prerequisite: Manipulating Data in Google Sheets
Data Science at Swarthmore	This 45 minute workshop will give an overview of how to hone your data science skills at Swarthmore. We will cover which classes develop these skills (including some less obvious ones!) and other resources, such as the Social Sciences Quantitative Laboratory, that are available	No prerequisite; 45 minutes

Cherry Picking Data: The Widespread Problem of P-Hacking	P-hacking is a common way to cherry pick your results by selecting regressions and t-tests that are artificially significant. The kicker is that many people don't know they are doing it. We look at the connection, or lack of connection, between political parties and national economic health. We discuss how p-hacking happens, why it's a problem in social science research, and how to avoid it.	No prerequisite
Experimental Methods	Experiments are often the gold standard method for uncovering causal connections; i.e., are campaigns that are randomly assigned to receive higher donations more likely to win? Yet they are tricky to pull off, and even trickier to apply to the relevant population. One common pitfall is experimenting on college students, then assuming that college students behave like the rest of the world. We discuss the relevance of lab and field experiments, and how they are implemented.	No prerequisite
Data Visualization: The Good, the Bad, and the Ugly	Data visualization is a powerful tool to communicate a point, but can also be misused. We discuss the history of graphics in data interpretation, how graphics can highlight important theories, how to create your own graphics using Google Sheets, and how graphics are used to misinform. Reference: Tufte, Edward, and P. Graves-Morris. "The visual display of quantitative information.; 1983." (2014).	No prerequisite
Sampling and the 2016 Election	Random samples are the basis for many statistical methods, including polling people to predict election winners. We use the 2016 election as an example of good and bad sampling methods, examining when the polls correctly predicted election results and why they sometimes got it wrong.	No prerequisite
Digital Tools in Research	Text is everywhere, yet the systematic study of large quantities of text as a way to understand the world is still in its infancy. I demonstrate how I use some of these skills to reveal an aspect of why rich white men are better represented in policy. Tweets by members of Congress, the text of their budgetary documents detailing staffing resources, and the bills they create reveal that members of Congress from poor districts are distracted from policy because they spend more effort helping their constituents navigate the social safety net. Rich white men are represented, in part, because they require less help with the federal bureaucracy, freeing their politicians to make policy.	No prerequisite
Game Theory in Social Science: When Philosophy meets Math	Game theory is mathematical philosophy for social science. We start with the classic prisoners' dilemma. Instead of prison terms we use a tastier incentive to reach the best outcome considering your opponent's best strategy of play: brownies. We discuss the ways that game theory has improved social science theory, and where it still needs improvement.	No prerequisite
Theory and Data Analysis	From data selection and data cleaning, to the final statistical results, all data analysis relies on solid theoretical grounding. We discuss the role of theory in statistical analyses, both historically and in the modern era. We discuss papers that have developed strong theoretical justifications for their techniques, as well as papers that have data mined their way to results that fail to match their theoretical basis.	No prerequisite

PROGRAMMING WORKSHOPS		
Introduction to R	This introductory session is based on a survey conducted on workshop participants. We cover the basics of opening files, running commands, creating summary statistics and graphics, dealing with outliers, and manipulating variables.. We also work through how to deal with errors (which are inevitable, but manageable, in any statistical package). This will be hands on, practical experience: each participant will be using the program in real time.	No prerequisite
Mapping Data in R	R is a data analysis language that can be used to create impressive visuals. Participants will learn how to import data from the census and create cartographs (maps displaying quantitative data) of US areas that interest them.	Prerequisite: none
Introduction to Visualizing Data in R with Data on Partisanship in Presidential Elections	Two packages in R provide powerful tools for visualizing data: ggplot and plotly. This workshop uses a dataset on partisanship, county demographics, and deaths of despair to demonstrate the power of these packages. You will learn to create maps, barplots, scatterplots, and 3 dimensional scatterplots, as well as the potential to publish this data online. In the process we discover the correlations between unemployment, deaths of despair, voting for Trump, and more.	Prerequisite: Experience programming in R
Stata: Using the Interface and Creating Summary Stats	This introductory session is based on a survey conducted on workshop participants. We cover the basics of opening files, running commands, creating summary statistics and graphics, dealing with outliers, manipulating variables, and labelling variables. We also work through how to deal with errors (which are inevitable, but manageable, in any statistical package). This will be hands on, practical experience: each participant will be using the program in real time.	No prerequisite
Stata: Hypothesis Testing	Using a dataset on county demographics, presidential voting, and deaths of despair, this workshop covers several additional basics of data analysis. This includes scatterplots, boxplots, standard errors/standard deviations/normal distributions, and the fundamentals of developing useful theories.	Prerequisite: Using the Interface and Creating Summary
Stata: Regressions	Using a dataset on county demographics, presidential voting, and deaths of despair, this workshop covers how to use Stata to create regressions, test regression assumptions, manipulate data to make it satisfy regression assumptions, and understand model specification and interaction terms.	Prerequisite: Regressions
Stata: Manipulating and Analyzing Data, Part 1	This workshop covers (1) the importance of the unit of observation for understanding how to manipulate data, (2) merging multiple datasets, (3) reshaping data to change the unit of observation, and (4) collapsing data to a higher unit of observation.	Prerequisite: Using the Interface and Creating Summary
Stata: Manipulating and Analyzing Data, Part 2	This workshop covers the basics of loops, the importance of documenting your work and version control, and creating codebooks for your data. We also touch on more advanced techniques and tricks for processing data, including fuzzy matching, looping through files, systematically renaming variables, regular expressions, and invisible characters.	Prerequisite: Manipulating and Analyzing Data, Part 1
Stata: Replicating Empirical Analyses in Stata	We uncover the complex relationship between unemployment and voter turnout. This session implements and interprets regressions in Stata, as well as delves deeper into the interpretation of p-values, standard errors, and standard deviations. This replication highlights the importance of omitted variable bias and outliers: the results are fundamentally wrong when we exclude educational attainment, or include invalid data points.	Prerequisite: Regressions

	Paper: Burden, Barry C., and Amber Wichowsky. "Economic discontent as a mobilizer: unemployment and voter turnout." The Journal of Politics 76.4 (2014): 887-898.	
Stata: Visualizing data	Based on the classic work on visualization by Edward Tufte, this session extends the analysis of unemployment and voter turnout by looking at graphical methods for interpreting the relationship between education, unemployment, and voter turnout. This also serves as additional exploration of omitted variable bias in regressions. In addition, we explore the famous data in Anscombe's quartet to better understand how necessary data visualization is to any data analysis project.	Prerequisite: Replicating Empirical Analyses in Stata
	Paper: Burden, Barry C., and Amber Wichowsky. "Economic discontent as a mobilizer: unemployment and voter turnout." The Journal of Politics 76.4 (2014): 887-898.	
Stata: Exporting analyses into Tex/etc and for loops	We have learned how to run regressions and create graphics. The next step, covered in this workshop, is to present those results to others. This workshop introduces Latex, a versatile text formatting package, as one way to present regression results and images. We also use Word and Excel to format regression results and graphics. In the process we examine the importance of variable selection. Finally, a versatile programming method called "for loops" is introduced.	Prerequisite: Visualizing data
	Paper: Burden, Barry C., and Amber Wichowsky. "Economic discontent as a mobilizer: unemployment and voter turnout." The Journal of Politics 76.4 (2014): 887-898.	
Stata: Preparing for a Data Analysis Interview and Take Home Assignment, Part I: Data analysis	It is common to receive a take home assignment as part of a data science/data analysis interview. We cover many common requirements of such an assignment using a dataset from IMDB. This includes technical skills such as importing data, recoding variables, and creating graphics and regressions. More importantly, we discuss what to focus on (data validity, limitations, and theoretical development) and how to present both your results and code.	Prerequisite: Exporting analyses into Tex/etc and for loops
Stata: Preparing for a Data Analysis Interview and Take Home Assignment, Part II: Data manipulation	This workshop covers a second type of take home assignment: data manipulation. Again using the IMDB dataset, we discuss how to create a new version of an existing dataset and why people would find this useful. We cover for loops and conditionals in more depth.	Prerequisite: Preparing for a Data Analysis Interview, Part I: Data analysis
Best Practices in Data Analysis and Coding	This workshop covers the tools required to produce easily interpretable, reproducible code. This includes smart data cleaning practices, the importance of consistent output, structuring a do file and comments, and variable naming conventions. Most importantly, we cover the importance of theoretical development for any data analysis project, and how to concisely describe the purpose of your code as it relates to your theory.	Prerequisite: experience in Stata or R
Manipulating Data	This workshop covers (1) how to use Excel more effectively, (2) which tasks Excel can perform better than a statistical programming package such as R, SPSS, or Stata, and (3) how to organize data effectively.	Prerequisite: experience in Stata or R
